- This is an **Informational** draft
- **Today:** first time presented at DNSOP
- Versions and mailing list discussion:
  - **-03 (2019-03-11)**: (minor changes from -02)
  - **-02 (2019-03-08):** link list thread (no responses)
  - **-01 (2018-12-20):** link list thread (no responses)
  - **-00 (2018-11-28):** link list thread
- Github link:

    `draft-moura-dnsop-authoritative-recommendations`

Context

- 13 people that have had 5 research papers:
  - Draft authors + Ricardo de O Schmidt, Wouter B. de Vries, Moritz Müller, Lan Wei, Cristian Hesselman, Jan Harm Kuipers, Pieter-Tjerk de Boer and Aiko Pras.
- Relevant papers with *recommendations* backed by large-scale, Internet-wide measurements:
  - 4x ACM IMC
  - 1x PAM
- However, papers tend to be *long*, *detailed* – they explain *why*
- **Target group:** large authoritative DNS ops, with global traffic

This draft:

```
papers =[]
papers.append(Moura16b)
papers.append(Mueller17b)
papers.append(Schmidt17a)
papers.append(Vries17b)
papers.append(Moura18b)

for p in papers:
  recommendations = TLDR(p) #great filter :-)
  print(recommendations)
```

- Tangible, direct recommendations to OP folks on *what* to do
- With references to papers to know *why*
Recommendations in a nutshell

- R1: Use equally strong IP anycast in every authoritative server to achieve even load distribution [1]
- R2: Routing Can Matter More Than Locations [2]
- R3: Collecting Detailed Anycast Catchment Maps Ahead of Actual Deployment Can Improve Engineering Designs [3]
- R4: When under stress, employ two strategies [4]
- R5: Consider longer time-to-live values whenever possible [5]
- R6: Shared Infrastructure Risks Collateral Damage During Attacks [4]

R1: Use equaly strong IP anycast in every authoritative server to achieve even load distribution
- **Resolvers** will query **ALL** authoritatives [1]
  - (conclusions drawn from Ripe Atlas, `.nl` and the Roots data)
- However, nearby authoritative servers will receive more queries

R1: Use equaly strong IP anycast in every authoritative server to achieve even load distribution

- For OPs: latency of *all* Auth servers matter
- Unicast, by definition, cannot deliver good global performance
- [1] recommends: use anycast at *all* Auth servers
  - equally strong in peering and capacity; and phase out unicast.
- This recommendation has been deployed at `.nl`.

R2: Routing Can Matter More Than Locations

- When evaluating an anycast DNS provider, people always ask: "how many sites/instances" do you have?
- Assumption: more sites → lower latency
- [2] shows that this is not always true:
    - `c-root`: 8 locations.
    - `k-root`: 33 locations
    - `l-root`: 144 locations
    - Their **median RTT: 30–32 ms** to 7.9k Atlas probes
- In other words, similar latency values for different deployments

- Why? BGP is agnostic to geographical distance
  - A client in California may be answered by a site near NRT – even though there is a closer site in SFO
- [2] thus recommends carefully considering **routing** and **connectivity** when engineering DNS anycast services
  - 12 sites is enough to provide good global latency
 - However, more sites may be helpful in case of DDoS [4]

R3: Collecting Detailed Anycast Catchment Maps Ahead of Actual Deployment Can Improve Engineering Designs

- Say you run an anycast service with *n* instances
- Say you want to add 1 more instance in LAX
- How will that affect traffic among your other locations?
  - **Very hard** to predict without measurement

R3: Collecting Detailed Anycast Catchment Maps Ahead of Actual Deployment Can Improve Engineering Designs
- Solution:
  - measure anycast catchments *ahead* of deployment
  - create anycast maps from these measurements
- [3] presents an ICMP-based tool (Verfploeter) for this solution
  - https://github.com/Woutifier/verfploeter
- Applied to `b-root` to **predict** query load on LAX:
  - Predicted: **81.6%**
  - Actual: **81.4%.**
- Current deployments:
  1. Anycast testbed (http://anycast-testbed.nl)
  2. `B-root`
  3. Large unnamed operator

Your Anycast NS

LAX AMS NRT GRU

DDoS

- BGP will map traffic to locations
- Best course of action?
  1. Do nothing and let LAX become a degraded absorber
  2. Withdraw/prepend routes to shift traffic
- Best option depends on attack and NS specifics

Your Anycast NS

LAX   AMS   NRT   GRU
DDoS Load distrib   50%   20%   10%   20%

DDoS

- BGP will map traffic to locations
- Best course of action?
  1. **Do nothing and let LAX become a degraded absorber**
  2. Withdraw/prepend routes to shift traffic
- Best option depends on attack and NS specifics

12

Your Anycast NS

LAX AMS NRT GRU

DDoS Load distrib 50% 20% 10% 20%
25% 25% 25% 25%

DDoS

- BGP will map traffic to locations
- Best course of action?
  1. **Do nothing and let LAX become a degraded absorber**
  2. **Withdraw/prepend routes to shift traffic**
- Best option depends on attack and NS specifics

12

Your Anycast NS

| LAX | AMS | NRT | GRU |

DDoS Load distrib | 50% | 20% | 10% | 20%
25% | 25% | 25% | 25%

DDoS

- BGP will map traffic to locations
- Best course of action?
  1. **Do nothing and let LAX become a degraded absorber**
  2. **Withdraw/prepend routes to shift traffic**
- Best option depends on attack and NS specifics

R5: Consider longer TTL values whenever possible

- TTLs set how long queries should remain in resolver's cache
  - Sort of "ephemeral replication"
- [5] emulates DDoS attacks (50-100% packet loss)

Figure 1: TTL: 1h; 100% Packet loss after $t = 10$min

R5: Consider longer TTL values whenever possible

- Caching is a *key* component of DNS resilience
- Resolver's retries as well
    - they may even "hammer" authoritative servers
- As such, [5] recommend longer TTLs whenever possible

R6: Shared Infrastructure Risks Collateral Damage During Attacks

- Be careful when engineering DNS services:
  - co-location implies you share (parts of the) infrastructure
- [4] found that when the Root DNS was attacked, some `.nl` co-located sites also went down
- Dyn 2016 Attack shows similar results
  - multiple zones were only partially reachable when NSes were attacked
- Conclusion: be aware of shared infrastructure risk

Questions?

- R1: Use equaly strong IP anycast in every authoritative server to achieve even load distribution [1]
- R2: Routing Can Matter More Than Locations [2]
- R3: Collecting Detailed Anycast Catchment Maps Ahead of Actual Deployment Can Improve Engineering Designs [3]
- R4: When under stress, employ two strategies [4]
- R5: Consider longer time-to-live values whenever possible [5]
- R6: Shared Infrastructure Risks Collateral Damage During Attacks [4]
